

A.M. Leonard's
ARBOR RAIN
DEEP SOAKING HYDRATOR FOR TREES AND PLANTS

CAPACITY

Provides an abundant amount of water to hydrate root ball and surrounding soil, minimizing transplant shock.

5 TO 8 HOUR DRIP TIME

Slow release rate insures water gets where it is needed – into the root zone.

LOW PROFILE DESIGN

Visually unobtrusive. Use on all trees and shrubs up to six inches in diameter.

DOUBLE EMITTERS

Distributes water evenly across the root area for complete coverage.

REINFORCED LIFT TAB

A convenient hand hold tab for easy filling.

THREADED CAP

Easy grip, threaded cap.

HIGH CAPACITY FILL PORT

1 5/8" diameter fill port accommodates a wide variety of hose sizes for quick filling.

Installation Instructions

1. Plant tree or shrub at proper depth and maintain a level mulch surface, as pictured to the right.
2. Position the ArborRain evenly around the trunk on top of the mulch.
3. Loosen the threaded black cap and insert hose, filling with roughly 3 gallons of water.
4. With water now in the ring, gently pull ring into shape, making sure bottom surface is completely flat, then continue filling, using tab handle to raise filling port for maximum capacity.

Note: The ArborRain is designed to provide proper watering for most plantings when filled once a week. However, there are many factors that effect watering needs, such as plant type, soil type and weather conditions. It is best to periodically check soil moisture content and adjust fill schedule accordingly.
